Science Department

The Science Department curriculum is geared toward increasing students' awareness of the impact the technological and scientific developments have on the world around them. The basic courses of Biology, Chemistry and Physics are constructed in an effort so that students may develop a more complete understanding of their environment. This year additions to the present curriculum include: Integrated Calculus and Physics, Animal Behavior, Topics in Physical Science, and Science Technology in the American Society. The department's structured curriculum gives students an opportunity to explore answers to the complex questions of man and his relationship with the universe.

Charles Waters searches for the answers in his pond.
