

SCIENCE

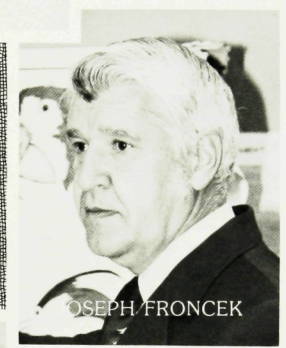

The Science Department operates with the philosophy that science must be made available to all students in some form. The major goal of the Science Department is to continue to extend a variety of new courses, as well as to offer the standard courses of biology, chemistry and physics to all students. This year, a new link in the program is a course entitled *Nuclear Science and Energy Resources*, an investigation into the understanding of nuclear energy which is a vital part of today's energy chain.
